

Sysmon Event ID Reference

Sysmon event IDs with closest native Windows Event ID counterparts and detection use cases.

Sysmon EID	Event Name	Description	Windows EID	Used For / Detection Value
1	Process Create	Logs process creation, including full command line, hashes, and parent process.	4688	Malware detection, LOLBins, PowerShell abuse, reconnaissance.
2	File Creation Time Changed	Logs when a process changes a file's creation timestamp — often used to evade forensic timelining.	N/A	Anti-forensic activity, timestomping.
3	Network Connection	Logs TCP/UDP network connections, including source/destination IP and port.	5156	C2 detection, malware beaconing, data exfiltration.
4	Sysmon Service State Changed	Logs when the Sysmon service itself starts or stops.	N/A	Detecting tampering with Sysmon logging itself.
5	Process Terminated	Logs when a process exits.	4689	Confirming process lifetime and execution duration.
6	Driver Loaded	Logs loading of kernel-mode drivers, including hash and signature status.	N/A	Kernel-level rootkits, malicious/unsigned drivers.
7	Image Loaded	Logs when a module (DLL) is loaded by a process, including signature status.	N/A	DLL injection, malicious DLL loading.
8	CreateRemoteThread	Logs when a process creates a thread in another process — common in process injection.	N/A	Process injection, malware loading code into another process.
9	RawAccessRead	Logs raw disk access reads, often used to bypass file system security.	N/A	Credential theft tools reading disk directly (e.g. NTDS.dit).
10	ProcessAccess	Logs when one process opens a handle to another process — used to detect credential dumping.	4656	Credential dumping (LSASS access), Mimikatz detection.
11	FileCreate	Logs file creation and overwrite events.	4663	Malware dropping files, persistence files, suspicious executables in Temp/AppData.
12	RegistryEvent (Object Create/Delete)	Logs creation and deletion of registry keys.	4657	Persistence setup and teardown, malware configuration changes.
13	RegistryEvent (Value Set)	Logs when a registry value is modified — key for spotting persistence.	4657	Persistence via Run keys, credential theft tool configuration.
14	RegistryEvent (Key/Value Rename)	Logs renaming of registry keys or values.	4657	Persistence and defense evasion via renamed keys.

Sysmon EID	Event Name	Description	Windows EID	Used For / Detection Value
15	FileCreateStreamHash	Logs creation of alternate data streams, with file hash.	N/A	Detecting files hidden in alternate data streams.
16	ServiceConfigurationChange	Logs changes to the Sysmon configuration itself.	N/A	Detecting tampering with Sysmon's own detection coverage.
17	PipeEvent (Pipe Created)	Logs creation of a named pipe, often used in C2 and lateral movement (e.g. PsExec).	N/A	Lateral movement via PsExec, C2 named pipe communication.
18	PipeEvent (Pipe Connected)	Logs a connection to a named pipe.	N/A	Confirming lateral movement / C2 pipe activity end-to-end.
19	WmiEvent (WmiEventFilter)	Logs registration of a WMI event filter — used for WMI-based persistence.	N/A	WMI persistence, fileless malware.
20	WmiEvent (WmiEventConsumer)	Logs registration of a WMI event consumer — used for WMI-based persistence.	N/A	WMI persistence, fileless malware.
21	WmiEvent (WmiEventConsumerToFilter)	Logs binding of a WMI consumer to a filter, completing a WMI persistence chain.	N/A	WMI persistence, lateral movement.
22	DNSEvent (DNS Query)	Logs DNS queries made by processes, including the queried domain.	N/A	Malware C2 domains, DNS tunneling, phishing callbacks.
23	FileDelete (Archived)	Logs file deletion and archives a copy of the deleted file.	4660	Malware cleanup behavior, anti-forensic activity.
24	ClipboardChange	Logs changes to the contents of the Windows clipboard.	N/A	Clipboard-based credential or data theft.
25	ProcessTampering	Logs process image tampering, such as process hollowing or herpaderping.	N/A	Process hollowing, defense evasion via image tampering.
26	FileDeleteDetected	Logs file deletion events without archiving the file (lighter-weight version of Event ID 23).	4660	Malware cleanup behavior without the storage cost of archiving.
27	FileBlockExecutable	Logs when Sysmon blocks an executable file from being written to disk.	N/A	Confirms active blocking of dropped executables.
28	FileBlockShredding	Logs when Sysmon blocks a file shredding (secure delete) attempt.	N/A	Anti-forensic activity prevention.
29	FileExecutableDetected	Logs detection of an executable file being created on disk.	N/A	Early-stage detection of dropped executables.

Note: "N/A" means there is no direct native Windows Event ID equivalent — Sysmon provides visibility that the default Windows audit logs do not capture on their own.
